*For 2014 – 2017, all ages within the band of 0 through 20 had ratio of .65 when compared to age 21 rate*

*When a rate is known for an age, but an estimate of the rate for a different age is desired, take the rate for the “known” age, divide it by its corresponding premium ratio, and then multiply it by the premium ratio for the “different age”*

*Example: If Age 46 Rate is \$441.65, and you want to know the approximate rate for age 30, the equation would be as follows:  
 $\$441.65 \div 1.5 \times 1.135 = \$334.18$*

*Note rate may not match exactly due to rounding*
